

Example: Determining the measures of central tendency from a histogram

Calculating the mean from a histogram

Complete the table that follows:

- 1-List the frequency of each interval
- 2-Determine the midpoint (value) of each interval
- 3-Multiply each midpoint value by its corresponding frequency
- 4-Add each of these products and divide by the total frequency

Interval	<u>Frequency, f</u>	<u>Midpoint, m</u>	$f \times m$
100-150			
150-200			
200-250			
250-300			
300-350
